

STEPS TO A SUCCESSFUL PASTURE

***Proper pasture management can improve yields and longevity by:**

- resting
- fertilizing
- clipping weeds and rotational grazing.

***Soil test and fertilize as needed**

***When reseeding, ensure good seed to soil contact**

No matter what seeding method you use the objective is the same, to ensure good seed to soil contact. This helps to ensure that the seed will germinate and emerge in a timely manner. The main seeding methods are frost seeding, minimum till, no-till and conventional seeding.

***Seed at the proper time of year**

***Seed to the proper depth**

***Use high quality certified seed that is adapted to your area**

Remember that renovation does not always mean ripping up your pasture and starting again. By working with your pasture and changing some management practices its productivity can improve greatly.
